
Base candidates $B^L = \frac{1}{2}(\tilde{P}^L + \tilde{P}^{R\to L})$, $B^R = \frac{1}{2}(\tilde{P}^R + \tilde{P}^{L\to R})$; $\alpha \in [0,1]^{T\times J\times 1}$ is predicted per joint and frame.

No camera intrinsics, extrinsics, or epipolar geometry are used at any stage.
